

# Ethikantrag

## Ethics application

eingereicht zur Begutachtung durch die  
Ethikkommission des Fachbereichs Psychologie und Sportwissenschaft an der Universität Münster.

submitted for review by the  
Ethics Committee of the Faculty of Psychology and Sports Science at the University of Münster.

| <b>2. Kurze Beschreibung des Vorhabens</b><br>Brief description of the project                                                                                                                                           | With a large number of published research comes the need to efficiently assess research quality. Researchers have been relying on journal prestige, usually approximated by a journal's average number of citations. We will investigate how researchers and citizens predict replication outcomes in the presence and absence of journals' impact factors. We compare this relation to the actual relationship between impact factor and replication outcomes. For this, we used data from the FORRT Library of Reproduction and Replication Attempts (Wallrich et al., 2026) and a gamified paradigm "Guess The Replication" (GutheR). |  |

|                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |

| <b>3. Geplante Methoden</b><br>Planned methods                                                                                                                                                                                                                                                 | <p>To collect data on people's predictions of replicability and to drive attention towards replication studies, we created a browser game that resembles the popular guessthecorrelation.com. That is, the style is pixelated, there are sounds for correct and wrong answers, players' score will be ranked on a leaderboard, players get a certificate that they can share with others on social media, and it can be played with keyboard, mouse, or on smartphones.</p> <p>The aim of Guess the Replication (GutheR) is to correctly predict replication success based on only the title, abstract, study number (if applicable) and - for 50% of the trials - the impact factor of the original publication's journal.</p> |  |
| <b>4. Körperliche Beanspruchung</b><br>Physical strain                                                                                                                                                                                                                                         | <p>People may experience fatigue after playing a high number of rounds (i.e., completing trials).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| <b>5. Kognitive Beanspruchung</b><br>Cognitive strain                                                                                                                                                                                                                                          | <p>People who predict the replication outcomes wrongly may have negative experiences. This could be exacerbated by the “wrong” sound played after each wrong estimate and a low final score and no leaderboard placement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |
